

Introduction to MySQL

Session III

Oct 16, 2014
Coalition for Queens

Dan Goldin
dan@dangoldin.com

Agenda

1. Review GROUP BY/JOINS
2. Subqueries in an IN
3. Subselect JOINS
4. Exercises

GROUP BY

- Allows us to aggregate and group our data
 - `SELECT [fields], [aggregate functions]`
`FROM [table] GROUP BY [fields];`

GROUP BY

- We need to make sure that what we're SELECTing matches what we're GROUPing BY

```
SELECT week,  
       SUM(points) AS total_points,  
       SUM(passing_tds) as total_passing_tds  
FROM stats  
GROUP BY week;
```

GROUP BY

Raw data

| week | player_id | points |
|------|-----------|--------|
| 5 | 2 | 16.81 |
| 5 | 1 | 13.51 |
| 5 | 3 | 13.54 |
| 5 | 4 | 12.81 |
| 6 | 2 | 20.72 |
| 6 | 1 | 14.2 |
| 6 | 4 | 14.55 |
| 6 | 3 | 13.85 |
| 7 | 2 | 16.96 |
| 7 | 3 | 15.52 |
| 7 | 4 | 15.46 |
| 7 | 1 | 14.02 |
| 8 | 2 | 20.94 |
| 8 | 1 | 14.43 |
| 8 | 3 | 13.25 |

GROUP BY week

| week | total_points |
|------|--------------|
| 5 | 56.67 |
| 6 | 63.32 |
| 7 | 61.96 |
| 8 | 61.28 |

GROUP BY player_id

| player_id | total_points |
|-----------|--------------|
| 1 | 56.16 |
| 2 | 75.43 |
| 3 | 56.16 |
| 4 | 55.48 |

Exercises

- Describe the columns and data returned by the following query:

```
SELECT name AS player, count(*) AS count  
FROM players  
GROUP BY name;
```

Exercises

- Describe the columns and data returned by the following query:

```
SELECT week, count(*) AS num_games  
FROM schedule  
WHERE home_id IN (1,2,3,4,5,6)  
GROUP BY week;
```

Exercises

- Describe the columns and data returned by the following query:

```
SELECT week,  
        sum(rushing_tds) AS total_rushing_tds,  
        max(rushing_tds) AS max_rushing_tds,  
        sum(receiving_tds) AS total_receiving_tds,  
        max(receiving_tds) AS max_receiving_tds  
FROM stats  
WHERE points > 0  
GROUP BY week;
```

Exercises

- Now write queries to do the following:
 - Retrieve the number of total projected points by week for all weeks past 11.
 - Retrieve the number of players in our dataset for each team (team_id).

JOIN

- Allows us to merge data from multiple tables (Think VLOOKUP in Excel)
 - `SELECT [fields] FROM [table1] JOIN [table2] ON [join condition];`

JOIN

- Without a join condition, we'll get the combination of everything.
- Question: If we join the following two tables, how many rows will the resulting table have?

positions

| id | name |
|----|------|
| 1 | QB |
| 2 | RB |
| 3 | TE |
| 4 | WR |

players

| id | name | position_id | team_id |
|----|---------------|-------------|---------|
| 1 | Carson Palmer | 1 | 1 |
| 2 | Matt Ryan | 1 | 2 |
| 3 | Joe Flacco | 1 | 3 |
| 4 | EJ Manuel | 1 | 4 |
| 5 | Cam Newton | 1 | 5 |

JOIN

- To make it easier to write complicated queries, we can also alias table names.
 - Gives tables a shorter name to reference throughout a query
 - Allows us to include the same table multiple times

JOIN

```
SELECT week,  
        name,  
        name  
FROM schedule  
JOIN teams ON schedule.home_id = teams.id  
JOIN teams ON schedule.away_id = teams.id;
```

```
SELECT s.week,  
        t1.name AS home_team,  
        t2.name AS away_team  
FROM schedule AS s  
JOIN teams AS t1 ON s.home_id = t1.id  
JOIN teams AS t2 ON s.away_id = t2.id;
```

Exercises

- Describe the columns and data returned by the following queries:

```
SELECT  
  p.name AS player_name,  
  t.name AS team_name  
FROM players p  
JOIN teams t ON p.team_id = t.id
```

Exercises

- Describe the columns and data returned by the following queries:

```
SELECT  
  p.name AS player_name,  
  q.name AS position  
FROM players p  
JOIN positions q ON p.position_id = q.id  
WHERE q.name in ('WR', 'TE');
```

Exercises

- Describe the columns and data returned by the following queries:

```
SELECT t.name AS team_name,  
        count(*) as num_players  
FROM teams t  
JOIN players p ON t.id = p.team_id  
GROUP BY t.name  
ORDER BY num_players DESC;
```

Exercises

- Describe the columns and data returned by the following queries:

```
SELECT t.name, sum(s.points)
FROM stats s
JOIN players p on p.id = s.player_id
JOIN teams t on p.team_id = t.id
GROUP BY t.name;
```

Exercises

- Now write queries to do the following:
 - Retrieve the name of every home team playing in week 9.
 - Retrieve the name of every away team playing in week 6.

Subqueries

- Use a query within another query
 - SELECT [fields] FROM [table] WHERE [field] IN ([other query]);
 - SELECT [fields] FROM [table] JOIN ([other query]) ON [join condition];

Exercises

- Which is the inner query? What does it do?
- Describe the columns and data returned by the following queries:

```
SELECT name
FROM players WHERE team_id IN (
  SELECT id
  FROM teams
  WHERE name IN ('NYJ', 'NYG')
);
```

Exercises

- Which is the inner query? What does it do?
- Describe the columns and data returned by the following queries:

```
SELECT sum(points)
FROM stats
WHERE week IN (
    SELECT week
    FROM schedule
    GROUP BY week
    HAVING count(*) < 16
);
```

Exercises

- Which is the inner query? What does it do?
- Describe the columns and data returned by the following queries:

```
SELECT p.name, s.total_points
FROM players AS p
JOIN (
    SELECT player_id, SUM(points) as total_points
    FROM stats
    GROUP BY player_id
    HAVING total_points > 100
) AS s on p.id = s.player_id;
```

Exercises

- Which is the inner query? What does it do?
- Describe the columns and data returned by the following queries:

```
SELECT t.name as team_name
FROM teams AS t
JOIN (
    SELECT team_id, count(1) as num_players
    FROM players
    GROUP BY team_id
    HAVING num_players > 10
) AS p on p.team_id = t.id;
```

Exercises

- Write queries (any way you want) to do the following:
 - Find the total projected points scored by each position.
 - Find the total projected points scored by each position by week.
 - Find the total projected points scored by each position by week for weeks > 10 .

Different join types

SQL JOINS

```
SELECT <select_list>
FROM TableA A
LEFT JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
LEFT JOIN TableB B
ON A.Key = B.Key
WHERE B.Key IS NULL
```

```
SELECT <select_list>
FROM TableA A
INNER JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
RIGHT JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
RIGHT JOIN TableB B
ON A.Key = B.Key
WHERE A.Key IS NULL
```

```
SELECT <select_list>
FROM TableA A
FULL OUTER JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
FULL OUTER JOIN TableB B
ON A.Key = B.Key
WHERE A.Key IS NULL
OR B.Key IS NULL
```
